Abstract

This project is a console-based Student Management System developed in C language. It supports two user roles: admin and student. The system can add, search,update and delete student records,input marks,calculate results,manage attendance,save data and generate result reports.It applies modular programming ,arrays,switch-case and loops to handle student information about studying efficiently.

Introduction

Manual management of student information,marks and attendance is inefficient and easy to get errors.This system provides separate admin and student dashboards. Admin can manage students' data, enter marks and check results, while students can view their own information and results. It aims to practice structured programming and file handling in C.

Methodology

1. The system is written in C language with structured modular programming.
2. Two login panels: Admin Login and Student Login with password verification.
3. Arrays are used to store student information, marks, results and attendance data.
4. Loops and conditional checks valid date when user input.(do-while)
5. Switch-case creates layered menus for navigation.
6. Automatically calculate total marks, average marks, grades and final results (Pass/Fail).

6. Independent functions build for add,search,update,delete,mark calculation and attendance management.
7. File handling is used to save and load data permanently.

Current Progress

Completed:

1. Main Menu (Admin Login / Student Login /Exit).
2. Admin Login screen with username and password verification.
3. Admin Dashboard with a numbered menu entries.
4. Student Login screen with ID and password verification.
5. Student Dashboard with a numbered menu entries.

Future Plan:

The next stage of development will focus on completing the remaining features:

1. Add and view students' information.
2. Search for a student (by ID).
3. Enter marks, calculate result.
4. Attendance management.
5. Generate result reports.
6. Save data.
7. Add the functions: update,delete, password change.

Conclusion

The navigation and login structure are built, laying a foundation for further development.
